Exercise 2 - Filtering Even Numbers

Overview

My Submissions/Test Runs

Instructions

You are going to write a List Comprehension to create a new list called `result`. This new list should only contain the even numbers from the list `numbers`.

DO NOT modify the List `numbers` directly. Try to use **List Comprehension** instead of a **Loop**.

Example Output

```
[2, 8, 34]
```

Hint

1. Use the keyword `method` for starting the List comprehension and fill in the relevant parts.
2. Even numbers can be divided by 2 with no remainder.
3. Remind yourself of how the modulo operator works.

Test Your Code

Check your code is doing what it is supposed to. When you're happy with your code, click submit to check your solution.
