## Exercise 3 - Adding Even Numbers

[Overview](#)[My Submissions/Test Runs](#)

### Instructions

You are going to write a program that calculates the sum of all the even numbers from 1 to 100. Thus, the first even number would be 2 and the last one is 100:

i.e.  $2 + 4 + 6 + 8 + 10 + \dots + 98 + 100$

Important, there should only be 1 print statement in your console output. It should just print the final total and not every step of the calculation.

### Hint

1. There are quite a few ways of solving this problem, but you will need to use the `range()` function in any of the solutions.

### Test Your Code

Check your code is doing what it is supposed to. When you're happy with your code, click submit to check your solution.
