Exercise 2 - KeyError Handling

| Overview | My Submissions/Test Runs |

Issue

We've got some buggy code, try running the code. The code will crash and give you a **KeyError**. This is because some of the posts in the `facebook_posts` don't have any `"Likes"`.

Bad Output

```
Python 3.8.2 (default, Feb 26 2020, 02:56:10)

Traceback (most recent call last):
  File "python", line 12, in <module>
NameError: name 'facebok_posts' is not defined

```

Instructions

Use what you've learnt about exception handling to **prevent** the program from crashing.

Hint

1. You'll need to catch the KeyError exception.
2. Posts without any likes can be counted as 0 likes.

Test Your Code

Check your code is doing what it is supposed to. When you're happy with your code, click submit to check your solution.
